1 INTRODUCTION

1.1 Project overview

- 1.1.1 York Archaeology (Nottingham) were commissioned by Pegasus Group, on behalf of Exagen, (hereafter referred to as “the Client”) to conduct an Archaeological Evaluation on Land to the West of Wysall, Nottinghamshire as part of the pre-determination process for the proposed development of a Solar Farm (herein referred to as “the Site”, Planning reference: P24/00161/FUL) (NGR 59437 28020 and 59520 26980, figure 01).
- 1.1.2 In accordance with the Written Scheme of Investigation (York Archaeology 2024) a total of 140 evaluation trenches measuring c.50m × 1.8m were machine excavated, providing an approximate 2% sample of the Site. The design of this evaluation phase was informed by the results of a geophysical survey conducted in 2024 by Magnitude Surveys (Magnitude Surveys 2024), which identified several concentrated areas of possible archaeological features. For the purpose of providing a broad overview of the archaeological preservation within the two land parcels, these have been referred to within this document as Area 1 (SK 59437 28020) and Area 2 (SK 59520 26980) (Figures 02 - 03).
- 1.1.3 This document offers a brief summary of the results of the programme of Archaeological Evaluation, highlighting the key areas of archaeological significance, and a basic quantification of the artefactual material recovered, to help inform the determination of planning application P24/00161/FUL and is not intended for the purposes of formal record. A full Trial Trench Evaluation will follow.

1.2 Site Description

- 1.2.1 The northern parcel (Area 1, centred on NGR: SK 59437 28020) is approximately 65ha in area and includes nine agricultural land parcels and buildings associated with Lodge Farm, Bradmore Road, Wysall. It is crossed by three public rights of way, and is bounded by Bunny Old Wood to the north, an ancient coppiced woodland (Nottingham Wildlife Trust 2023). To the east, west and south, it is bounded by agricultural land.
- 1.2.2 The southern parcel (Area 2, centred on NGR SK 59520 26980) covers an area of approximately 33ha and includes six agricultural land parcels, which are enclosed by field boundaries to the north, south, east and west.

1.3 Aims

- 1.3.1 The general aims of the evaluation were to:
- To identify the presence of any archaeological remains to be affected by any intrusive aspects of the development.
 - To attempt to quantify any such archaeological remains encountered by identifying their form, nature and date.
 - Where practical (within the constraints of the development), this included an assessment of the overall extent, date, and state of preservation of archaeological remains.
 - To provide evidence so that the potential need for further works can be identified.

2 RESULTS

2.1 Area 1: Trenches 01 - 80 & 141

- 2.1.1 Area 1 encompassed the northern land parcel of the Site, and contained Trenches 01 – 80 and 141.
- 2.1.2 Three distinct areas of archaeological activity were identified in Area 1 (figure 02). These chiefly comprised a series of boundary ditch systems relating the three wider enclosures, which had been initially identified by the geophysical survey. These are detailed below as Area 1A, 1B and 1C. A summarised set of tabulated results can be seen in Appendix 1.
- 2.1.3 Within most of the trenches the natural substrate was directly overlain by topsoil, with only a limited number having a subsoil and/or a colluvial deposit. Deeper trenches containing colluvial deposits were predominately encountered to the northeast of Area 1, close to the managed watercourse which formed the principle north by south land boundary within Area 1 which formed the central current field boundaries.

Area 1A: Trenches 12, 13, 16, and 72 (Figure Nos. 02, 05, 07 & 08)

- 2.1.4 The geophysical survey identified one arm of a possible linear enclosure-like feature and several linear anomalies extending to the north and south within the centre of Area 1 (figure 02). A number of strong “internal” anomalies were also identified, which proved to represent a series of post-medieval extraction pits that truncated the linear features.
- 2.1.5 A north-west by south-east aligned ditch, broadly aligning with the geophysical anomaly, was encountered within Trench 13 [1306] (Plate 1), but did not extend into in Trench 12 where it may have been truncated by a later quarry extraction pit. No dating evidence was retrieved from this main ditch, however a single sherd of possible prehistoric pottery and a piece of non-diagnostic CBM was recovered from a second ditch within Trench 12 [1202]. Two undated outlying ditches, [7203] and [7205], were also recorded within Trench 72 which may be related to the same enclosure-like feature.
- 2.1.6 Trench 16 contained two small pits. One contained no finds [1605], but pit [1603] contained the remains of a probable un-urned cremation. Three sherds of possible prehistoric pottery were recovered from the same fill.

Area 1B: Trenches 64-68, 70, 71, and 141 (Figure Nos. 02, 9 & 10)

- 2.1.7 The results of the previous geophysical survey (Magnitude Surveys 2024) identified a cluster of probable and possible linear and rectilinear anomalies to the southeast of Area 1 that may form a series of enclosures, covering an area of approximately 175m by 190m (figure 02). However, the archaeological evidence, which included evidence for a potential robbed out foundation trench, a truncated wall, a cobbled surface, numerous post holes and artefactual evidence which included Roman CBM, indicates that there may be at least one Roman building within this area which has not been identified by the geophysical survey.
- 2.1.8 Trench 69 could not be excavated due to live services, but a shorted trench (141) was opened instead following liaison with NCC in an area where there appeared to be a concentration of stones within the plough soil.

- 2.1.9 Machine excavation of the Trenches located to target the geophysical anomalies revealed a density of features in addition to those identified within the survey. It was agreed in consultation with NCC to excavate a subsample of these in order to characterise the date, extent and form of the activity in the Area. The artefactual evidence, whilst limited, was clearly of Roman origin and included fragments of Samian ware, a piece of mortarium, and possible fragments of imbrex and tegula.
- 2.1.10 Trench 64 targeted a series of north-south aligned linear features identified on the geophysical survey which might have represented the northern entrance to the enclosure. Eight ditches and five postholes were observed within the trench, with some evidence for intercutting indicating different phases of activity. Several of these features were not previously identified by the geophysical survey. The principal ditches had a broad V-shaped profile and contained multiple fills (Plate 2), which are typical in ditched features of Roman date.
- 2.1.11 Trenches 65 and 66 targeted the western limit of the Area of archaeological density identified by the geophysical survey, which appeared to be delineated by two parallel north by south aligned ditches (Plate 3), potentially indicating the boundary had been renewed. Trench 65 also contained an east-west aligned ditch which appeared to terminate within the enclosed area, forming an internal division. Trench 66 was observed to contain a series of small pits or postholes, and what appeared to represent the truncated remains of a stone wall [6604], formed of uncoursed rubble.
- 2.1.12 Trenches 67, 68 and 141 were situated within the archaeologically dense area identified by the geophysical survey. A series of shallow intercutting ditches and gullies aligned broadly aligned east by west, which may represent internal divisions. However, several of these features were not identified by the geophysical survey.
- 2.1.13 Trench 141 also contained the remains of a possible metallised surface (14116) which sealed an adjacent ditch or robbed out foundation trench (Plate 4). To the south east of the metallised surface there was a possible posthole [14112], measuring 0.96m x 0.8m wide x 0.4 m deep, in which packing stones were identified (Plate 5). The form, fill and proximity of the post holes suggests it may have been of a contemporary date or function of the metallised surface and potential robbed out wall.
- 2.1.14 Trenches 70 and 71 lay east of the enclosure and contained a series of smaller ditches (Plate 6) which are sealed by alluvial deposits. The geophysical survey indicated that there may have been features within this area, but the survey data did not correlate with those encountered during the excavation. A small quantity of Romano-British ceramics was recovered from Trench 71, suggesting that the features may have been contemporary to the main area of activity.

Area 1C: Trenches 58 and 59 (Figure Nos. 02, 10 & 11).

- 2.1.15 Trench 58 contained an undated curvilinear ditch not previously identified on the geophysical survey (Magnitude Surveys 2024) The feature [5803/5806], measured c.9.5m in diameter (Plate 7), though no datable material was recovered. The remains of an undated articulated sheep skeleton were identified deposited within a shallow pit [5807] to the south. The geophysical survey identified a possible L-shaped linear feature forming the north limit of a possible enclosure to the south of the ring ditch, which was identified within Trench 59 [5903]. Hand excavation revealed a U-shaped profile measuring 1.56m wide and 0.64m deep, that yielded no finds.

Other features

- 2.1.16 Ridge and furrow was observed to survive in part as earthworks within the wider study area. Associated furrows were recorded within Trenches 07, 10, 11, 20, 24, 25, 26, 27, 28, 30, 33, 35, 37, 39, 40, 47, 48, 60, 61, 62, 63, 75, 76, and 80, and of which a subsample were excavated and recorded. This is consistent with aerial photographs and 1m DTM LiDAR data; which shows the Site lying within what would have been an open field system, with ridge and furrow aligned NNW-SSE and WNW-ESE across the now enclosed landscape.
- 2.1.17 A number of isolated undated ditches and pits likely representing infilled field boundaries and land management features were encountered within Trenches 07, 09, 23, 31, 48, 49, 52, 56, 57, and 73.
- 2.1.18 Throughout the Site, ceramic field drains were encountered. They were typically cut into the natural substratum, truncating the archaeological horizon, and this pattern of drainage generally appeared on the same alignment as the agricultural furrows encountered.
- 2.1.19 Made ground deposits formed of redeposited clays were encountered within Trenches 12, 13, and 17, which likely represented the infilling of quarry/extraction pits. Ceramics recovered from the infilling deposits indicated that they were of post-medieval date, however they are not depicted on any available historic maps.

2.2 Area 2: Trenches 81 – 140 (Figure No. 3)

- 2.2.1 Area 2 encompassed the southern land parcel and contained Trenches 81 – 140. Trenches yielded intermittent subsoil and/or colluvial despoils overlying the natural substratum. All trenches were sealed by agricultural topsoil.
- 2.2.2 Two distinct areas of archaeological activity were identified within Area 2 (2A and 2B) (figure 03), each representing a series of undated ditched features relating to two possible wider enclosure systems initially identified by the geophysical survey. An outlying kiln was recorded within Trench 128 within Area 2C, at some distance from the principal areas of archaeological activity, suggesting that there is potential for archaeological features not identified by the geophysical survey to extend beyond the areas currently identified. The principle features are detailed below; and Appendix 1 contains a summary of tabulated results.

Area 2A: Trenches 84, 86 and 87 (Figure Nos. 03, 13 & 15)

- 2.2.3 The geophysical survey identified a series of possible archaeological features within this northwestern quadrant of the Area 2, possibly forming partial enclosures or trackways. Hand excavation positively identified the features, however, they proved to be extensively truncated by post-medieval quarrying activity which had presented as a natural spread on the geophysical survey. Preservation appeared to be greater to the north within Trench 87, wherein three sides of a small enclosure was recorded (Plate 9) alongside a series of smaller internal gullies, a possible posthole alignment, and two inhumations. Whilst no datable material was recovered, the ditches appeared to represent the earliest phase of activity, with the posthole alignment seen to extend perpendicularly across the projected alignment of the ditch. The two inhumations were encountered at the eastern end of the trench outside of the ditched enclosure suggesting they may represent a later phase of land use. The poor condition of the easternmost inhumation meant that preserving it in-situ was not possible (Plate 10), and following its full excavation it was observed that the burial had overlain part of the posthole alignment. The second inhumation was preserved in-situ.

- 2.2.4 A series of shallow ditches and gullies were encountered within Trench 86 which broadly aligned with the results geophysical survey, but no dating evidence was recorded.
- 2.2.5 Extensive flooding within Trench 84 caused by a broken drain prevented the excavation of the features. One ditch appeared to broadly align with the geophysical survey, although it was likely that the features in the northern end of the trench may have represented later quarrying activity.

Area 2B: Trenches 92-95 and 101-104 (Figure Nos. 03 & 13 - 16)

- 2.2.6 The geophysical survey identified a series of probable archaeological features forming an east-west aligned enclosure with a series of internal divisions.
- 2.2.7 The principal east-west aligned boundary ditches were encountered within trenches 94, 101, 102, 103 and 104, and were typically characterised as having broad shallow profiles (Plate 11), with smaller narrower gullies to the north. No evidence for the internal north-south aligned divisions were encountered within any of the trenches apart from Trench 101 (Plate 12), although a series of shallow pits were recorded throughout the enclosure. Whilst some animal bone was encountered within features fills, no datable ceramic material was identified.
- 2.2.8 Trenches 92 and 95 contained a series of shallow broad ditches (Plate 13), irregular pits and natural hollows infilled by water lain clay rich deposits, suggesting an ongoing effort to manage ground water levels. Trench 93 contained two shallow gullies, but quarrying activity had disturbed much of the trench.
- 2.2.9 Agricultural furrows observed elsewhere within the Site were conspicuously absent within this area, and whilst later quarrying activity may account for this, the preservation of archaeological deposits within the same trenches indicates that this specific area never formed part of an arable field system, and may have formed an area of waste or grazing land. It is likely that the archaeological features identified in this area represent a series of small temporary livestock enclosures associated with this land use, however this remains uncertain due to a paucity of datable finds.

Area 2C: Trench 128 (Figure No. 3 & 16)

- 2.2.10 A possible kiln was recorded within Trench 128 [12802] (Plate 14). This was formed by a large circular pit measuring at least 1.23m long, 2.38m wide 0.74m deep, with stones laid across its base (12817) and extending into a possible flue (12811). Charcoal rich deposits were identified along the edges of the pit alongside elements of fired clay. No chronologically diagnostic material was recovered from the overlying fills.

Other features

- 2.2.11 Ridge and furrow survives in part as earthworks within the southern boundary of Area 2, and associated furrows were observed within Trenches 108, 111, 113, 115, 123, 124, 125, 126, 129, 130, 133, 136, 137, 138, 139, and 140.
- 2.2.12 Isolated undated ditches likely representing infilled field boundaries and land management features were encountered within Trenches 85, 107, 109, 110, 113, 123, 130, 136 and whilst they were not wholly aligned those depicted on the 19th and 20th Ordnance Survey maps, they were observed to run broadly parallel with the current field boundaries.

- 2.2.13 A series of stone quarries, or extraction pits were encountered within Trenches 88, 89, 90, 91, 93, 94, 96, 97, 98, 99, 100, 105, and 106 (Plate 15, Plate 16) from which fragments of CBM, and single sherd of post-medieval Willow Pattern Ware were recovered. Historic mapping does not show these areas of extraction, but the Ordnance Survey Map of 1884 depicts an area of plantation in the northern extent of the Site, known as Stone Pit Plantation. It had been suggested that the name indicated that there may have been a quarry in this vicinity, which has been corroborated by the results of the archaeological record. The same map shows a trackway extending through the same area, which broadly aligns with a cobbled surface identified within Trench 96 alongside the extraction pits.
- 2.2.14 Throughout the Site, ceramic drains were encountered; these were sealed by the topsoil and were cut through any present subsoils. They typically cut into the natural substratum truncating the archaeological horizon and this pattern of drainage generally appeared on the same alignment as the agricultural furrows encountered, similar to Area 1.
- 2.2.15 Trenches 81-83 contained a series of gullies with contemporary ceramic field drains. These were situated within an area of former plantation which was established by the beginning of the 20th century and cleared before 1985. A small pit with Trench 81 contained a significant amount of charcoal and coke, and may represent the waste material from industrial processing associated with the plantation. The only anomalous feature encountered was the edge of a possible ditch [8108] at the northern end of Trench 81 (Plate 17), which whilst undated, differed in form and composition to the other ditches, and may have represented evidence for earlier activity in the area.

3 SUMMARY DISCUSSION

- 3.1.1 A total of 140 evaluation trenches measuring 50m × 1.8m were excavated across two Areas of the proposed development, providing an approximate 2% sample of the Site. These works followed a geophysical survey conducted in 2024, which identified several concentrated areas archaeology features within Areas 1 and 2 (Figures 02 - 03).
- 3.1.2 The evaluation revealed that the anomalies detected by the geophysical survey were present as cut archaeological features within the evaluation, that appear to represent a multiphase landscape with localised areas of activity dating to the prehistoric and Roman periods. Much of the datable evidence was found within Area 1B, wherein evidence for a potential robbed out foundation trench, a truncated wall and cobbled surface, as well as numerous post holes were identified, alongside Roman CBM, indicating that may be at least one Roman building within this area, potentially associated with a higher-tier farmstead or low-tier villa.
- 3.1.3 A smaller, possibly prehistoric, enclosure was identified in close proximity to an un-urned cremation within an area of post medieval quarrying, to the northwest within Area 1A, and an undated ring ditch and enclosure were also recorded to the south of Area 1 within Area 1C.
- 3.1.4 Two undated enclosure groups were recorded within Area 2. The northwest within Area 2A displayed evidence for multiple phases of activity, and containing at least two inhumations, and the enclosure within Area 2B may have represented a stock enclosure. A possible kiln was also encountered within Area 2C within Trench 128, away from the enclosed areas.
- 3.1.5 Elsewhere within the Site there was evidence for post-medieval quarrying, as well as features associated with land management and strip cultivation.
- 3.1.6 The archaeological remains identified within the Site may be considered to be of regional significance due to their potential association with a Roman building. Whilst detailed interpretations of date and function are not possible at this early evaluation stage, the archaeological evidence from area 1B is indicative of a higher-tier farmstead or low-tier villa site. Whilst elsewhere within the site there is further evidence for contemporary peripheral settlement and funerary activity.
- 3.1.7 The evidence recovered from the evaluation at Wysall has parallels within the wider landscape where other Romano-British sites have been identified, including a series of contemporary features previously identified on land directly adjacent to the Site to the west (York Archaeology 2024), and the site of a Roman well with speculative ritual associations, and a corn drying kiln which were recorded approximately 910m to the north-west of Area 1 (Pegasus Group 2024).
- 3.1.8 This document offers a brief summary of the results of the programme of Archaeological Evaluation, highlighting the key areas of archaeological significance, and a basic quantification of the artefactual material recovered, to help inform the determination of planning application P24/00161/FUL and is not intended for the purposes of formal record.

3.3 Mitigation Strategy

- 3.3.1 In line with discussions with the Pegasus Group and their Client (Exagen), the proposed development design remains flexible, and the level of mitigation required for those Areas of Archaeological Significance highlighted in Figures 02 - 16 which have been identified during the pre-determination trial trench evaluation will be agreed following the receipt of the full evaluation report.
